

Amendments to the Specification:

Please replace paragraph [33] with the following amended paragraph:

[33] Returning the error value to the user processor in step S22 is a process which depends on the assumption that the fault is generated in the user buffer address checking function. The safeguard exception processor assigns certain processes to the corresponding faults according to errors and faults in the Kernel area. Further, the Kernal processes a fault generated in the Kernal area as a simple error.
